ABSTRACT
Companies and individuals are cognisant of the gravity of the environmental problem and advocate for the implementation of a sustainable business model. Green behavior of employees, a form of pro-environmental action at work, is crucial for the organisation to reach its goal of area conservation. To promote Green Transformational Leadership, it is crucial to understand the causes and effects of pro-environmental behaviour, as well as the factors that influence these factors. This systematic literature review offers a comprehensive review of research articles related to green transformational leadership on employee behavior. It comes from many articles about the application of green transformational leadership on student academic achievement. Empirical results have supported our hypothetical model, showing that green transformational leadership has an indirect influence on green behavior of employees through value alignment, and that this mediating effect can be moderated by green identity.

KEYWORDS
Systematic Literature Review; Green Transformational Leadership; Employee Behavior

Introduction
Companies and individuals are aware of the gravity of the environmental problem and are calling for establishing a sustainable way of operating. Green behavior of employees, a type of pro-environmental action at work (Sobaih et al., 2022), extremely significant for the organization to achieve the objective of area conservation. To promote Green Transformational Leadership, it is important to comprehend the causes and effects of pro-environmental behavior, as well as what influences these elements. For example, some researchers have explored the antecedents of employees’ green attitudes at work, in terms of industry strategy (T. Chen & Wu, 2022), procedures for human resources (J. Zhou et al., 2021) so is the leadership style (Wang et al., 2018). Leadership characteristics and behavior greatly influence the behavior of subordinates in any organizational environment (Cahyadi et al., 2023). As a result, important elements of green transformational leadership have been uncovered through numerous studies, according to one leader who stated that this type of leadership has the goal of lowering barriers so that people can engage in pro-environmental activities (L. Huang et al., 2023) during Employee behavior (Al-Swidi et al., 2021). The focus of this research is green transformational leadership, which is defined as the characteristics of a leader or a leader’s style when leading, motivating, and encouraging a group of people. This study also answers the question, “How does a leader become a leader?” (Al-Swidi et al., 2021). The subject matter of literature covers a variety of leadership styles, from conventional, such as, for example, transnational leadership (that Bass uses as a typology) to contemporary (such as leadership that is agile) (Li et al., 2020). Studies have been conducted in the past that describe the hallmarks of a leader found in the relevant style code and list of tools necessary to identify a particular style code (S. Zhou et al., 2018).

The cornerstone of entrepreneurial transformation is “value-based leadership” (Al-Swidi et al., 2021), We have found quite a bit of research exploring how transformational green leadership affects green employee performance remotely. From this, the main mechanism of using green values which is understood to affect employee job performance is possible to involve value. Although while leaders have recognized the importance of green transformational leadership in assisting the development of employee behavior, there is still much to be learned about how organizations can help these leaders develop employee behavior from the “inside out”, through their own values (L. Huang et al., 2023). Principles of transformational leadership based on law (Al-Swidi et al., 2021), It can be detrimental to subordinates’ values and cause subordinates to become separated from the leader who was to be separated from the leader in question. (L. Huang et al., 2023). It has long been understood that a person’s location is a key factor in their success, thus anyone with some environment friendly value must work much more to succeed in...
their endeavors. Due to this, it is extremely important to consider the relationship between the ruling party and the employee pro-environment from a private perspective. (S. Zhou, et al., 2018).

Value has an abstract style that emphasizes what people find important in their daily lives. However, understanding the important information does not guarantee that people will define themselves in this manner (Jia et al., 2018). For example, if you are constantly on a mobile device (perhaps traveling far from your place of business), you may not define yourself as an environmental steward. We believe that their real identity is green employees as recognized by others as pro-environmental individuals (Majali et al., 2022), will influence their green transformational leaders on the level of their value congruence. A transformative green leader, a person with a green identity can be expected to become more persistent in self-identifying by using green information about the leader's words and business dealings. Green Transformational Leadership and the interaction with employees and individual values can be moderated by the similarity of their identities (Sun et al., 2022).

It is clear from the description above that the single most important factor affecting the workplace or business world is Green Transformational Leadership. Transformational leaders help employees to shift their attention to goals that are conducive on long-term organizational development and subordinates, in turn, can internalize the values espoused by them (Asrofi et al., 2020). If a transformational leader truly has green values, there is reason to believe that he or she will impart wisdom to green behavior under that leader (Buil et al., 2019). For example, such a leader can inspire the workforce to overcome barriers by emphasizing factors that help the organizational environment, promote strong organizational growth, and address environmental issues in innovative ways; such leaders create a pro-environmental mindset and carry out pro-environmental activities in an organization; they suggest a transformational leader for specifically in regards to a person's career path. Due to this, the author of the review in question has given it the title "Green Transformational Leadership Regarding Employee Work". The aim of this literature review is to synthesize findings from previously published studies related to the impact of Green Transformational Leadership on employee candidates. Therefore, the focus of this research is "leadership style on employee performance obtained through previous research". The data summary from the survey uses a secondary summary from the previous survey.

Literature review

Study of green transformational leadership

In the last 200 years, transformational leadership has been a primary priority among leadership domains (Liu & Yu, 2023); Numerous studies have established that the impact of transformational leadership on student achievement is particularly significant (Buil et al., 2019). Transformational leaders help employees to shift their attention to goals that are conducive on long-term organizational development and subordinates, in turn, can internalize the values espoused by them (Asrofi et al., 2020). If a transformational leader truly has green values, there is reason to believe that he or she will impart wisdom to green behavior under that leader (Buil et al., 2019). For example, such a leader can inspire the workforce to overcome barriers by emphasizing factors that help the organizational environment, promote strong organizational growth, and address environmental issues in innovative ways; such leaders create a pro-environmental mindset and carry out pro-environmental activities in an organization; they suggest a transformational leader for specifically in regards to a person's career path. Due to this, the author of the review in question has given it the title "Green Transformational Leadership Regarding Employee Work". The aim of this literature review is to synthesize findings from previously published studies related to the impact of Green Transformational Leadership on employee candidates. Therefore, the focus of this research is "leadership style on employee performance obtained through previous research". The data summary from the survey uses a secondary summary from the previous survey.

Study of green trasformational leadership for employees

As a general rule, positive leadership highlights transformational leadership highlights a positive and inspiring vision for the team and encourages alignment between organizational goals and personal goals. This, in turn, allows the team to internalize organizational goals into personal goals and take action to achieve them and inspires a vision for the team and encourages alignment between organizational goals and personal goals. This, in turn, allows the team to internalize organizational goals into personal goals and take action to achieve those goals (Green et al., 2022), the point at which personal values match the surrounding environment (S. Zhou, et al., 2018) been used to explain why the subordinates must remove their leader and announce values and defenses (J. Zhou et al., 2021). To view a green organization, a green transformational leader is more antagonistic than usual. They focus on developing useful green values for organizations and the environment, resulting in the creation of a policy that views employment as a reflection of their own values (Green et al., 2022). In this situation, internal organizational motivation interferes with achieving organizational goals by only focusing on external motivation (J. Zhou et al., 2021). This condition is because it indicates that those tasks are the culmination of their realization of their objectives, and that their performance of those tasks is in accordance with their personal philosophy (L. Huang et al., 2023). Although green transformational leadership does not change the rules of the game slowly, it does so in an effective way by relating the rules of the game to the rules of the workplace and continually discussing the differences between the two so that the individual rules of the game end up being the same or similar (Al-Swidi et al., 2021).
Methods

Review and Meta Analysis) was used to summarize this systematic literature review. On the theory underlying how the green method collects data for literature around the world in this case involving the use of the Science Direct database and the MDPI e-Journals. The PICO (Population, Intervention, Comparison, and Outcome) methodology, summarizing the data was carried out.

Results

This study employed the PRISMA approach for classification. Filtering is done on the data after the extraction procedure. Here is a PRISMA flowchart that illustrates a resource management approach.

![Figure 1. PRISMA chart](chart.png)
The literature to be compared with generally accepted validity standards will highlight the following characteristics. The latest literature report, the criteria consider general characteristics. In subsequent years: 7% in 2018, 13% in 2019, 20% in 2020, 23 in 2021, and 27 in 2022. The information used in this research was obtained from works that are divided into two (2) categories: superior subjects and employees, as well as Korean-style learning designs. Is 15% of literature on employment, employees, international literature written in English that meets the data inclusion criteria is available.

Discussion

**Study for green transformational leadership**

Leadership and employee behavior from the perspective of value alignment is the aim of this study. Uses a media model characterized by green transformational leadership and employee behavior to continue our previous research. Our analysis results show that green transformational leadership has a positive relationship with knowledge shared by practitioners and knowledge imparted through green transformational leadership practices (T. Chen & Wu, 2022). We also observe the interaction between green identity and green transformational leadership in determining appropriate target values for candidates (Al-Swidi et al., 2021). In addition, our research has shown that the effect of a person’s identity on moderation does not occur consistently. We used green transformational leadership to a green employee’s behavior using value alignment (Jia et al., 2018). This study refines previous research on employee green behavior by emphasizing value alignment as a mechanism that can increase employee green behavior (Majali et al., 2022).

We also have several very important theoretical and practical implications for employee and green transformational leadership (Zhang et al., 2021). Implications for Theory and Research contributions contained in this research is the first demonstration of green transformational leadership in action from a values perspective (Green et al., 2022). Value mechanisms are rooted in transformational leadership (Suliman et al., 2023), understanding of the impact of green transformational leadership on individual employees is still in its infancy (Tosun et al., 2022). The largest previous research has adopted the perspective of Subordinate Green Awareness or internal motivation (Farrukh et al., 2022), explore the mechanisms of internal green transformational leadership related to green employee behavior (Y. S. Chen et al., 2014). Our research has concluded that that green transformational leadership significantly increases the level of green behavior of subordinates through value alignment, green transformational leadership improves the mechanisms of green behavior of employees, significantly increase the level of green behavior of subordinates through the value of alignment, which enhances the way in which employees lead with sustainability (Green et al., 2022).

In addition, this study concluded that there is no consistent relationship between green transformational leadership and people’s leadership. has concluded a lack of a consistent connection between green transformational leadership and people’s leadership (S. Zhou et al., 2018), when differences in employee green identities emerge (T. Chen & Wu, 2022), namely the value of green identity can increase the influence of green transformational leadership values on their subordinates (Sobaih et al., 2022). This section demonstrates that green transformative leadership will pay off when dealing with employees who are too close to ‘green’. One’s identity greatly influences one’s perception of the outside world (Mansoor et al., 2021). It has been established through our research that individuals with a less strong green identity have a more difficult time understanding green cognition when they interact with the environment (Y. S. Chen et al., 2014). Hopes that this information can help Scholars to better understand the mechanisms that cause a person’s identity to be misidentified in an organization (Farrukh et al., 2022).

Another viewpoint for advancing hierarchical citizenship behavior for employees: Innovative authority work

Opening representatives' green imagination: The impacts of green groundbreaking initiative, green natural, and extraneous inspiration

Green human effect asset the executives, authority and hierarchical culture on representatives' green way of behaving and authoritative natural execution working together

Opening the connection between naturally unambiguous groundbreaking initiative and workers' green way of behaving: A social self-portrayal viewpoint

Anticipating the Connection between Green Groundbreaking Administration, Green Human Asset The executives Practices, and Representatives' Green Way of behaving

The outcomes uncovered four key discoveries. (1) A groundbreaking initiative style can really advance workers' OCBE, yet the four components of groundbreaking administration have different impacting ways and qualities on OCBE. (2) The inspiration of the pioneering vision straightforwardly drives the OCBE of the workers, and the power of impact is the greatest among all aspects. (3) The individual thoughts and morals of the two leaders show the progress of OCBE in a roundabout way through mental possession, and the impact of individualized thought is more prominent than the impact of moral displaying. (4) As opposed to our assumptions, initiative appeal affects OCBE. At long last, firm suggestions were proposed on the most proficient method to work with representatives' OCBE by changing the authority style, in this manner advancing the green and low-carbon advancement of endeavors.

The discoveries uncovered that green groundbreaking initiative impacts green inherent inspiration and green imagination, which are required for workers to create spotless and green items and administrations. Furthermore, green inborn inspiration to some degree intercedes the connection between green groundbreaking administration and green imagination. Running against the norm, green outward inspiration as a mediator marginally sabotages the green natural inspiration for green imaginative way of behaving. Consequently, authority in associations ought to raise the green inspiration of representatives with the goal that they might improve climate amicable and manageable items and administrations.

These findings confirm the impact of ecological concern, green human assets by executives and green initiatives on green authoritative cultures. In addition, green hierarchical culture was asserted to have a very large positive relationship with workers' green behavior and authoritative natural execution. Significantly, green hierarchical culture likewise intervenes the connection between ecological concern, green human asset the board, green initiative way of behaving and workers' green way of behaving. The innovation of this review adds to the ongoing writing on green way of behaving by inspecting these connections and testing the intercession impacts. It likewise offers rules for leaders on the most proficient method to expand representatives' green conduct in their working environment and thusly make a culture of harmless to the ecosystem association.

The results of multiple relapses were leveled to support the impact of the intervention through a green self-representative personality, and this impact was more pronounced when workers had a more grounded human-nature direction. outcomes recommend down to earth suggestions for molding and utilizing ETFL to develop representatives' green self-personality, consequently supporting their green way of behaving, especially for those with a more grounded man-nature direction.

In view of an underlying condition demonstrating examination, green groundbreaking authority and green human asset the executives rehearse decidedly impact representatives' green way of behaving. Green human asset the executives rehearses interveive the connection between green groundbreaking administration and representatives' green way of behaving. Little and medium endeavors ought to consider taking care of the green conduct issues of their workers by advancing the green idea in administration and human asset the executives rehearse. Such drives add to supportability in little and medium endeavors.

</table>

The outcomes affirmed a positive huge impact of GTFL on the two components of green way of behaving, i.e., task-related and favorable to natural way of behaving, and on ecological execution. The outcomes showed a halfway interceding impact of undertaking related conduct in the connection among GTFL and ecological execution, though supportive of natural way of behaving has an ideal intervention impact. The results showcase unique work supporting ecological behavior in influencing the above relationships and send an important message to pioneers in the food business about focusing on the behavior of environmental masters when selecting new representatives. Moreover, improvement projects ought to be led to upgrade the supportive of natural ways of behaving among representatives.

The results also confirm that green character leads to a circular impact of green breakthrough administration on representative green behavior through price compatibility, such that the distorted impact is more certain when green personality is high than when it is low. A discovery gave significant commitment to green ground-breaking initiative, esteem harmoniousness, and representative green way of behaving by investigating the connection between them. Down to earth suggestions and headings for future examination are likewise talked about.

Using the information of 243 chiefs in Central area China, underlying condition displaying results observed that institutional tension is emphatically associated to green ground-breaking authority, green ground-breaking administration is decidedly corresponded to green cycle advancement, green cycle development is emphatically connected to green item advancement, the development of green things is strictly related to the achievement of new green things, the green brand image directs the relationship between the development of green things and the implementation of new green things. The examination results provide hypothetical and functional consequences for efforts to reduce institutional tensions and build explicit green advantages.

The results show that green HRM is practiced in an effort to increase workers’ green awareness and consequently strengthen their green way of behaving and that green breakthrough and green survival initiatives take part in the positive direction in the above relationship. These results support the suitability of the asset preservation hypothesis in green administration and propose that green HRM practices and green breakthrough authorities can be used together over the time green administration spends.

This finding reveals that the authority of eco-friendly breakthroughs totally influences the green hierarchical personality, which develops the green imagination in SMEs. In addition, the results illustrate that green hierarchical personality does intercede in the relationship between green breakthrough management and green imagination. In addition, green reasoning intervenes in the relationship between green breakthrough management and green imagination. This study offers new experiences on how to turn on green breakthrough authorities and mental cycles in SMEs to generate green imaginations. The consequences for the board and experts were discussed in light of the review’s findings.
That's what the outcomes show: green groundbreaking initiative decidedly affects representative OCBE, and green hierarchical environment affects the effect of green groundbreaking authority on worker OCBE. In addition, concern for nature not only influences the impact of green breakthrough initiatives on a green authoritative environment, but also decisively directs the impact of green breakthrough administration impacts on workers’ OCBEs. This paper reveals the inner mental instruments of the further development of workers’ OCBEs and provides ideas for promoting sustainable business improvement.

Using a structural equation model and a survey questionnaire from small and medium-sized businesses, this study gathered data from 110 respondents. The results support GTL’s beneficial and considerable impact on EP. Additionally, GHRM and GI positively mediated between GTL and EP according to the mediation study. Additionally, the structural equation model supports the idea that EV acts as a moderator between GTL and EP. These findings provide insightful suggestions for all parties involved.

The outcomes show that green breakthrough initiative decidedly affects representatives’ assuming responsibility conduct and that individual drive plays an interceding job. Besides, green hierarchical character directs the positive impact of green breakthrough authority on workers’ own drive, and subsequently, their assuming responsibility conduct. These discoveries have hypothetical ramifications for the green breakthrough initiative writing and administrative ramifications for experts.

Drawing from the capacity inspiration opportunity hypothesis, we found that groundbreaking chiefs can rouse representatives’ green enthusiasm through impacting GHRM, and eventually emphatically influence workers’ green innovativeness. Information gathered from two sources (workers and HR directors) in clinical firms in upper east China at double cross focuses exhibited the significant impacts of groundbreaking administration, GHRM, and representatives’ green energy on green imagination, accordingly giving new hypothetical experiences and useful thoughts.

The discoveries of this study uncovered that green groundbreaking administration is decidedly connected with green item improvement execution. In addition, both green innovation administration and individual green quality have a positive impact on the green mental environment, driving progress towards green product improvement implementation in associations. Further, when green groundbreaking authority coordinates representatives with green qualities, establishing green mental environment in the association, in this way further developing the green items advancement performance is more favorable. The ramifications for experts are examined based on the experimental discoveries.
Green Groundbreaking Initiative and Green Execution: The Intervention Impacts of Green Care and Green Self-Adequacy

The Impacts of Green Groundbreaking Authority on Reception of Naturally Proactive Procedures: The Intervening Job of Green Commitment

Feeling of Representatives’ Green Innovativeness through Green Groundbreaking Administration and The board Drives

Effect of Green Groundbreaking Administration on Representatives’ Natural Execution in the Inn Business Setting: Does Green Work Commitment Matter?

Does Green Groundbreaking Administration Foster Green Absorptive Limit? The Job of Inside and Outside Ecological Direction

Green Groundbreaking Initiative, GHRM, and Proenvironmental Conduct: A Solid Drive to Natural Exhibitions of Little and Medium-Sized Undertakings

The results show that green historic authority clearly has an impact on green consideration, green self-practicality, and green execution. In addition, this study shows that the positive relationship between green historic authority and green execution is somewhat intervened by two middlemen: green consideration and green self-practicality. This implies that green breakthrough initiatives can directly affect decisively green execution as well as indirectly affect it decisively through green awareness and green survival. Furthermore, companies need to increase their green notable, green consideration, and green self-feasibility initiatives to expand their green presentation.

A side effect of this work is showing that the President’s green breakthrough administration absolutely predicts positive change from green commitments from top watchdog groups, which then predicts ecologically proactive methodologies. These findings provide hypothetical insights into the natural improvement field that could encourage the writing of ecologically proactive procedures.

This study demonstrates the meaning of cooperative energy between green HR exercises and association green procedures to strengthen representative green creativity. In addition, green management drives are also observed as logical antecedents of green TFL, which improves the way we interpret green TFL styles. Finally, the impact of green TFL intercession suggests that it can act as a proximal HR outcome for executing hierarchical green plans.

The discoveries of the review uncovered that green groundbreaking initiative affects green work commitment and ecological execution among inn representatives. Moreover, the connection between green groundbreaking administration and the inn representatives’ natural presentation was viewed as altogether decidedly and to some extent impacted by green work commitment.

Information collected from 315 companies with ISO 14001 certificates in the 1st and 2nd Overview 500 Current Undertakings of Turkey in 2018 were tried in the SmartPLS 3 audit program. Experimental evidence suggests that chief GTL affects FP both directly and by implication via CES and GPI. However, it is presumed that GFT does not strictly affect FP. Considering the GPT and separation procedure together, it appears that the relationship with FP is large and positive.

The discoveries likewise uncovered that (inward and outside) ecological direction somewhat intercedes the connection between’s the green groundbreaking authority and green absorptive limit. Thus, this exploration introduced new data on how green groundbreaking authority and the (interior and outside) ecological direction of entrepreneur administrators work on green absorptive limit in SMEs.

The insightful findings showed that GHRM and GTFL help enterprises upgrade their EP. Additionally, by establishing PEB to reach the EP of the organizations, the discoveries shed light on the roles of GHRM and GTFL in luring and persuading the representatives for the association’s natural improvement. By considering the GHRM and GTFL indicators as key predecessors of the PEB of representatives and the EP of the organizations, this study will add to the existing body of knowledge.
Conclusion

This study has provided some background information on how to facilitate transformational green behavior while enhancing green employee behavior. The results from, which use our hypothesized model as a guide, suggest that the influence of media on green identity can be modified by transformative green behavioral influences, which have short-term effects on behavior. green behavior can be modified by transformative effects, which have short-term effects on employee green behavior. We anticipate that the theories and arguments made in this research will lead to more theoretical and empirical research in to the relationship between leadershipy and green employee behavior.
